Azrael / Getty Images Automobile seats can be installed using two different methods: the vehicle safety belt or lower anchors and lighters for children (latch). Many parents wonder what option is the most sure way to install your child's automobile seat. In situations in which the installation is allowed, it is not usually safer than the other. There are two remarkable exceptions. First, as children become more heavy, most automobile seats require that it use the safety belt instead of the lower anchors of the latch system, since the safety belt is more S strong. Secondly, the automobile seats that have a rigid latch, instead of a lower anchor strap, are generally more secure when installed with a rigid latch against the vehicle's safety belt. For most seats, it is not safe to use both lower anchors and the safety belt at the same time. Although it must, in most cases, choose between the vehicle safety belt or the lower anchors (part of the latch system), the treasures are also used from the vehicle safety belt or the lower anchors for each Installation facing forward. Thus, if your automotive-oriented automotive seat is using the safety belt or lower anchors, it always adds the rope strap to secure the top of the automotive seat oriented forward. Some automobile seats oriented towards also use teter straps. Both the latch and the safety belt are equally safe in general, but if one is safer than the other depends completely on your child, your vehicle and you. The exception is a rigid latch, which is a more insurance installation method than a lower anchor strap or a safety belt. Vehicle seatbelt can always be worn in the traditional way, where it is routed through the path of the car seat belt and folded. The seatbelt that holds a car seat should be locked at all times, which means that the strap cannot be loosened. at all. This is very different from how our seatbelt is when we ride; It only locks when you hit the brakes. All seatbelts in the United States. UU. Since 1996 have a way to lock in order to use with a car seat. Most have a mechanism where if you pull out the Belt slowly out to the end, as I leave it again in it will continue to block and shorten. It only returns to normal when you leave that the belt re-enter. Some car seats have built-in locking devices for the safety belt that often facilitate the installation. The safety belt should also be tightened so that the car seat moves less than an inch in any direction when it is checked on the path of the belt. Using safety belts has some advantages: Safety belts are FA Ciles to find in any vehicle that is located. You will also be prepared in case you need to install the car seat in an older vehicle that does not have the LATCH system. (However, an older vehicle will probably be quite different and more challenging than a new car. If the vehicle is prior to 1996, the most likely is that it does not have the built-in block mode In the safety belt. In addition, older vehicles without LATCH will have no clamping anchors, so they are not suitable for forward-facing facilities). You can install the car chair in more The rear seat positions, since it is not limited to positions with lower anchors. Some car chairs have integrated safety belt closures that are easy to use. These built-in closures allow you to block the safety belt without having to understand if the safety belt has its own locking mechanism or how it works. Some car seats have security belt tensioning devices, many of which also They block the safety belt. These tensioning devices often significantly reduce the force needed to tighten the safety belt. Even if you are quite familiar with several safety belt systems and how you can to install a car chair, oted must consult the manual of the owner of the vehicle. will tell you how to lock the seat belt if necessary and give you the specific important installation details of your vehicle. the latch system has multiple components. the lower anchors are metal bars in the form of u or horizontal. Sometimes they are hidden inside the fold of the seat of the vehicle, and sometimes they are visible out of the seat.Most vehicles have two sets of lower anchors, one on the driver's side and the other on the passenger's side at the rear. Some vehicles may have lower anchor sets in all three rear seat positions. Often the middle seat in the second row and many positions in the third row (in vehicles with a third row) will not have lower anchors. Most vehicles do not allow you to borrow the lower anchorages (belonging to the driver and passenger seats) to install a car seat in the middle; the spacing is not the same. Even if you have one of the few vehicles that allow this, make sure you are using a car seat that allows this. There may be a label, button, or lower anchor symbol printed to tell you where the lower anchorages are in the vehicle. Even if you can easily locate the lower anchorages, you should still read through the LATCH section of your vehicle owner's manual. It will give you specific installation tips to your vehicle. The Car Seat Lady has information about where you can find the lowest anchorages and anchorages on any American vehicle made between 2000 and 2020, including which positions in the vehicle have these anchors and which do not. This table also shows which vehicles have LATCH center and links to a list of car seats that are allowed to be installed with lower anchors that are spaced wider than standard. The ether anchor is the second part of the LATCH system in your vehicle. It may look like the lower anchors, but there is only one per set of lower anchors. In an SUV or minivan, the kettle anchor is most often located at the back of the vehicle seat where the car seat is installed. However, in a sedan it is always on the shelf under the rear windscreen. Some vehicles, most The SUV vehicles or station wagons, have an anchor of teapot on the ceiling up and behind the rear seat. The vehicle owner's manual can give you the exact location of any teapot anchor in your vehicle. With some exceptions (such as convertibles or cars without rear seats), you will have an anchor to go along with each set of lower anchors, and almost always there is at least an additional tether anchor, also, that can be used along with a seat belt installation (seats should be used for all future-oriented installations, either with lower anchors or seat belts). For pick-up trucks, tether anchors can look very different than in other vehicles. They may even be washed links instead of metal. You should read the manual of the owner of the vehicle to learn how to use this type of kettle anchor. It's one of the only guys in which more than one seat in the car could share an anchor. The other parts of the LATCH system are in the car seat itself. Car seats have a way to connect to the lower anchors. Most use a strap with some type of hook that connects to the lower anchors of the vehicle. Some car seats have LATCH rigid where connectors are rigidly attached to the child's car seat frame and there is no strap involved. All front car seats have a kettle strap, which is a strap with a hook at the end that comes from the head of the child's car seat and connects to the kettle anchor in the vehicle. Some rear seats in the car also use kettle straps. The LATCH system was designed to allow the safety belts to be optimized to contain the human body and the lower anchors to install a car seat. For some car seats, rear seats in particular, another advantage of the installation with the lower anchors is that the seat of the car will not be tilted next to it due to the pressure of the shoulder of the vehicle seat belt. A seat belt installation where the built-in seat belt lock mode is used will cause you toan inclination. A safety belt installation with a built-in belt locking device in the car seat (which means that you do not have to use the safety belt locking mechanism) will not tilt the car seat. Some car seats offer an incredible facility of installation with LATCH. Seats with rigid latch (which are less common) offer a much easier installation than with a lower anchor strap. See the car seat instructions manual for information on LATCH specific parts in your car seat, including how to route the lower anchor strap if it is a convertible car seat. The stickers on the side of the car seat will also give some basic directions in the use of LATCH for your particular car seat. The safest installation method is the one that offers the safest installation (the seat moves as little as possible, always less than an inch in any direction). If you want to install the car seat in a rear center position, it usually requires the seat belt. Most vehicles do not have a set of lower anchors dedicated to the middle seat, and most do not allow the use of the inner anchors on both sides for installation in the center. Check the vehicle owner's manual to see if this is allowed. You will also need to check the manual of the car seat owner to see if the manufacturer approves the use of your seat with non-standard space of lower anchors. You may have heard that the central seat is the safest, which is true, statistically, although only slightly. A passenger can't hit the center directly. Sitting at the centre reduces the risk of injury from approximately 0.28% to approximately 0.17% for children of three and younger. So while it's safer, it's a little safer. But if it is easier for you to install your baby's car seat correctly with LATCH, it is perfectly acceptable to use one of the outer seat positions to do so when LATCH is not available in the center or does not work well for you there. If the vehicle manufacturer put lower anchors and kettles on the points outside the table, they clearly intended that the children would ride there, and the vehicle has been tested from thatThe weight of your child also affects the security of the installation method. Car seats are tagged with a maximum weight for the installation with the lower anchors. The maximum weight for an installation of lower anchor may be different when the seat is used in the back that it turns forward. If your child's weight exceeds the weight limit to use the lower anchorages to install that particular seat, you will need to change and use the seat belt to install the car seat. Remember to keep using the tether strap on front-facing car seats, whether you are using seatbelt or lower anchors for installation. The car seat manual will give details on when to switch between LATCH and the seatbelt. Before deciding how to install your child's car seat, try all possible seat positions with the seat belt and lower anchors, if available. Get guidance from the owner's manual of the vehicle and the instruction book of the car seat. Find a seat safety event or technician in your area if you need extra help. Bottom line: The safest installation method is the one that you are able to get the tightest installation and is approved by the car seat and vehicle manufacturer.
