(and in the corresponding index file pages-articles.multistream.xml.bz2 contain the same XML content. So if you expand both, you get the same data. But with Multistream it is possible to get an article from the archive without unpacking everything. Your reader should do this for you. If the reader doesn't support it, it still works because the content of multiple streams and other streams contain the same XML file. The only downside to multiple streams contain the same XML file. that won't do you any good if you don't unzip it. And it expands to 5 to 10 times its original size. Economical on a small scale and yet wasteful. Get a multi-stream dumpcontains multiple bz2 "streams" (bz2 header, body, footer) combined into a single file, unlike a vanilla file that contains a single stream. Each individual "stream" (actually a file) in a multi-stream dump contains 100 pages, except perhaps the last one. How to use multistream.xml.bz2, the second is the article ID, the third is the article name. Cut a small part of the archive with dd using the byte offset found in the first file. See for information on such multi-stream files and how to decompress them using Python; see also /ariel/toys/bz2multistream/README.txt and related old work toys files. Other languages The dumps wikimedia.org directories correspond to the abbreviation of the language and the corresponding projects, not only in English. There are other directories (eg simple, nostalgia) with the same structure. These screenshots are also available at the Internet Archive. Images and other uploaded media are available from mirrors, but are not served directly from the Wikimedia servers. See the current list of mirrors. You should rsync from the mirror and then fill in the missing images from upload.wikimedia.org; You should limit yourself to 1 cache miss per second when downloading from upload.wikimedia.org (you can check the response headers to see if it was a direct hit and then go back if you missed), and you shouldn't.more than one or two simultaneous HTTP connections. In any case, make sure you have the exact user agent string with contact information (email address) so that the operation can contact you in case of problems. You need to fetch the checksums from the mediawiki API and verify them. The API tags page has some guidelines, although not all of them apply (for example, since upload.wikimedia.org is not MediaWiki, there is no maxlag parameter). Unlike the text of most articles, images are not necessarily licensed under the GFDL and CC-BY-SA-3.0. They may be under one of many free public licenses that are considered fair use or even copyright infringement (which should be removed). In particular, the use of fair use images outside of the context of Wikipedia or similar works may be illegal. Most licensed images require attribution and possibly other accompanying copyright notices. This information is contained in the image description pages that are part of the text dumps available at dumps.wikimedia.org. Finally, download these images at your own (legal) risk. Compressed dump files are heavily compressed, so they will take up a lot of disk space when decompressed. A comprehensive list of decompressed by in the Comparison of file archivers section. Specifically, the following programs is described in the Comparison of file archivers section. Specifically, the following programs is described in the Comparison of file archivers section. the basic decompressor decompressor decompresses zip files.[1][2] The following tools can be used to decompress bzip2 files, among others. bzip2 (command line) (hence) is available for free under the BSD license. 7-Zip is available for free under the BSD license. 7-Zip is available for free under the bzip2 command line utility. GNU/Linux Most GNU/Linux distributions include the bzip2 command-line utility. Berkeley Software Distribution (BSD) Some BSD systems ship with the bzip2 command-line utility as part of the operating system. Others, such as OpenBSD, ship it aswhich must be installed first. Notes Some older versions of bzip2 may not be able to handle files larger than 2 GB. So make sure you have the latest version if you run into problems. Some older archives are compressed using gzip, which is compatible with PKZIP (the most common Windows format). As files get larger, so does the chance that they will exceed a certain limit of your computing device. Each operating system, file system, disk space, and software (application) has a maximum file size. Each will likely have a different maximum, and the lower limit becomes the file size limit on the storage device. The older the computing device software, the more likely it is that there is a 2GB file limit somewhere on the system. This is due to legacy software that uses 32-bit integers to index files, limiting the file size to 2^31 bytes (2GB) (integers) or 2^32 (4GB) (unsigned integers). Older C libraries have been converted to 64-bit integers, so they support file sizes up to 2^63 or 2^64 bytes (8 or 16 EB). Before you start downloading a large file, check the storage device to make sure its file system supports files of that size, and check the free disk space to make sure the downloaded file can fit. File System limits the file system limit is less than the file system limits are usually negotiable. Many users assume that they can create files that do not exceed the size of their storage device, but they are wrong in their assumption. For example, a 16GB storage device formatted as a FAT32 file system has a file limit of 4GB per individual file. Below is a list of the most common file systems. See File System Comparison for more information. Windows supports FAT16up to 4 GB. FAT16 is the factory format for smaller USB drives and all SD cards with a capacity of 2 GB or less.
