Avery Martin's LDProd/iStock/Getty Images While prognosis for a Mac that doesn't recognize the internal hard drive might seem poor, there are several options that could help you recover your hard drive and determine if you really have a problem with your hard drive. Macs provide several clues to help you isolate and solve the most serious problems of your hard drive. In some cases, it is enough to restore the boot disk. More extreme problems require you to control the integrity of your hard drive and in some cases install a new hard drive for your system. Before blaming your hard drive, check to make sure the monitor works properly. You may have a problem with your monitor if the monitor does not light up with the gray boot screen. A broken monitor will not affect any of the other functions, such as fan noise, boot music and backlit keyboard on supported MacBooks. If the computer has one of these symptoms, it may be necessary to replace the monitor or, in extreme cases, the entire logical card. When you press the power button on your Mac, check to ensure you have no power problems. Make sure the light on the MagSafe adapter is green. If you use a MacBook, press the battery indicator button on the left side of your computer. A series of green dots should appear if you have a normally working battery. If your computer does not emit any sound whatsoever when you try to start your computer, then you have an unrelated problem to your hard drive. A Mac still tries to start and reaches the gray screen even if the computer does not have a hard disk installed. Make sure the current socket works by connecting a lamp or another electronic device. Sometimes, you may need to buy a new power adapter to fix the problem. Disconnect all non-essential devices for computer operation. This includes speakers, printers and any USB device not necessary. Your computer may not seem to recognize your hard drive due to a faulty USB connection. Sometimes your USB devices malfunction and draw too much power from your computer. When a device absorbs too much power, the computer turns off or disables the door by attracting excess energy to avoid an overload that could damage the computer. The System Management Controller guides many low-level settings on your Mac. These settings may cause problems with power supply and startup procedures and may present symptoms that mimic a hard drive problem. Try resetting the SMC to make sure the problem is not related to one of the many SMC-managed settings. On Mac desktop you can restore the SMC by turning off your computer, disconnectpower supply and wait 15 seconds before connecting and turning on the computer. On a MacBook with removable battery, turn off the computer, disconnect it, remove the battery and hold the power button for five seconds. Release the power button, replace the battery, connect the computer and turn on the computer to see if the problem is On laptops with batteries it is not possible to remove, turn off the computer and connect the MAGSAFE adapter. Press and release the Â«Shift-Control-Option» keys together with the ignition button at the same time. And then start the computer. Sometimes your Mac could lose track of the boot disk position. This can happen when you force the computer to turn off using the power button, or when a newly installed application destroys the system. You can manually select the start disk by holding down the «optionÂ» key while the computer starts. To check for errors on the disk, click on the hard disk with the «OS X Recovery» label and select the «Disk Utility.â €™ option Click the «First Aid» tab, select the disk and then click the «Repair.â €» button if the operating system is severely damaged, reinstall it could be the only option. If Disk Utility reports a fault hard disk, you need to back up as many data as possible and install a new hard drive if possible. Otherwise, you can hold down the «CÂ» key while the computer starts and select the «Reinstall OS XÂ» option and follow the instructions to reinstall the operating system. The process of reinstalling the operating system deletes everything, then make sure to back up as many data as possible. The information contained in this article apply to OS X Mountain Lion.
